Section One

An Overview of the Consumer Price Index

An Overview of the Consumer Price Index

1- The Consumer Price Index (CPI) Concept

The Index is a statistical indicator which measures the relative change in the values of a certain phenomena (Price, quantity, value, wage etc) through time, whereas, the Consumer Price Index, measures the changes of the prices of goods and services which comprise the household consumption expenditure during a specific period called the comparison period as against time period called the base period. This change in prices reflects the burden which be falls the consumer, cost of living and whether they are rising or falling, compared to the base period, hence obtain information about price trends, markets conditions and the cost of living

2- Uses of the CPI

The uses of CPI differ from one country to another but the following uses can be identified:

1. Socio-economic analysis and identifying the relevant policies.
2. Studying the relationship between wages and salaries and living conditions.
3. Explain the actual relationship or the relation between money and the goods and services that can be exchanged. Hence it is used as a deflator to transfer National Accounts from current to constant prices.
4. Studying and comparing the prices movement.
5. Reflecting the purchasing power of the unit of currency and inflation level.

3- Compilation of CPI in the Sultanate

The process of preparing the Consumer Price Index has undergone many development phrases. These developments have started in 1972 with the carrying out of price surveys which were confined to some goods in Muscat Governorate at the time when electronic systems were not available for use in the analysis of the survey data and obtaining the results. With the increased awareness about the importance of CPI, the modernization of the statistical work in this area continued to include the expansion of the geographic coverage, the goods and services basket in addition to updating the base year. These developments have been made possible by the huge advancement in information technology and related tools which facilitated the collection of prices electronically together with analyzing and obtaining the results for more than a decade now, which placed the Sultanate among the most advanced countries in this area.

Section Two

The Methodology

The Methodology

I- Construction of the CPI

CPI, as is the case with any statistical product, needs certain requirements for its preparation and compilation has been undergoing basic phrases and steps. The quality of this index depends on the availability of its requirements. The following is a review of the factors which are taken into consideration when compiling the CPI:

- 1- Weights (Relative Significance).
- 2- Consumer basket.
- 3- Geographical Scope and Price Survey Sources.
- 4- Price survey and auditing.
- 5- Base Year.

I-I Weights (Relative Significance)

The weighted CPI, as it is known, reflects the actual change in prices since the impact of prices on the consumer depended, to a large extent, on the importance of the good or service to the consumer, or its relative weight from total expenditure. In preparing the weighted average, weights are prepared which are the relative structure of expenditure derived from household expenditure and income surveys data. These weights include consumption expenditure only. Consequently, determining the relative importance of goods constituting the CPI have great impact and importance in the accuracy and representation of CPI.

The process of the compilation of the weights for the CPI series on the basis of 2012 as base year, depending upon Household Expenditure and Income Surveys of 2008/2009, 2009/2010, and 2010/2011. The updating of the selected goods and services weights in the goods and services basket for the base year 2012 through their prices in 2012 was also carried, so that the base year would be the same year of Household Expenditure and Income Survey which reflected the value of expenditure on goods and services. The following table shows the relative importance for goods and services by Governorate.

Relative importance(Weights) of the Main Groups by Governorate in Base year 2012

Group	Sultanate	Muscat	North Batinah	Dhahirah	Dakhliyah	North & South Sharqiah	Dhofar	Al Buraymi
Food and Non-Alcoholic Beverages	23.903	16.822	29.685	26.946	28.078	29.425	27.818	26.683

Source: Household Expenditure & Income Surveys, Average expenditure for the year 2008/2009, 2009/2010 & 2010/2011.

I - 2 Consumer Basket

The consumption expenditure of families includes a large number of items (goods and services) that are difficult to deal with them all, and hence it is not logical to use the prices of all goods and services used by consumers for compiling the CPI. Consequently, the practical conditions necessitate the selection of a group of goods and services which is considered representative of the consumption patterns of the community. Household Consumption and Income Surveys are the main source of this information about the different types of consumption during a whole year to cover the different seasons and conditions for families. The selected goods and services are called the consumer basket. The selected components of the consumer basket are divided into harmonized groups in accordance with the recommendation of SNA of the United Nations for the purpose of achieving coordination and complementarity between the different statistics produced by the statistical authority for serving the preparation of National Accounts.

The goods and services composing the consumer basket are divided into a number of main and sub- groups, in addition to the division into items, which is the last level. Goods and services are classified in accordance with the international classification (Individual consumption classification by purpose (COICOP)).

I-2-1 Main Groups (First Level)

The first level for classification of the Consumer Basket comprises twelve main groups as follows:

- 1- Foods & non-alcoholic beverages.
- 2- Tobacco.
- 3- Clothing and footwear.
- 4- Housing, water, electricity, gas and other fuels.
- 5- Furnishings, household equipment & routine household maintenance.
- 6- Health.
- 7- Transport.
- 8- Communications.
- 9- Recreation and Culture.
- 10- Education.
- 11- Hotels and Restaurants.
- 12- Miscellaneous goods and services.

I-2-2 Sub-Groups (Second Level)

Some of the main groups in this level were divided into a number of sub- groups, e.g., Food, beverages and non alcoholic drinks were divided into two groups: Food and non - alcoholic drinks..

I-2-3 Sub-Groups (Third Level)

In this group the second level groups were divided into secondary groups, specially groups which include a large number of goods e.g., Bread and Cereal Group were divided into five sub-groups which were: Rice, Flour, Bread and Bakery Products, Vermicelli and products and children products and other cereal products

I-2-4 Goods and Services Groups (Fourth Level)

The forth level represents goods and services obtained from Household Expenditure and Income Surveys, thus it is the basis on which price surveys depend. It is in the light of these goods and services the items comprising the consumer basket were chosen. Furthermore, average weights were built on this level. For instance, Rice group includes Indian, Pakistani and other types of rice.

I-2-5 Goods and Services Brands (Fifth Level)

For each good a number of widely used or traded items are selected. Three items were selected for each good and service in the forth level according to the nature of that particular good and service. When selecting these items due consideration was given to the basis of its representation in that it always represent the consumer's choice and its level of trading in the markets. Some services, however, were represented by one or two items. Before carrying this task, accurate description of these items in terms of shapes, unit of measure, the material made of, where it is manufactured, local or imported product and technical specification.... Etc must be done in addition to any comments which will assist in identifying the good or service so that no change in the price would occur due to changes in the unit of measure or specifications. The following items are given here as an example of the accurate classification of items:

- Indian Basmati Rice \ Tilda \ plastic bag \ 5 Kg \ India.
- Pakistani Basmati rice \ Guard \ plastic bag \ 5 Kg \ Pakistan.
- Wheat Flour \ Golden no. one \ Atta \ plastic bag \ 5kg \ Oman Flour Mills.

It is worth noting that goods and services for the base year 2012 included 28,168 price items.

I - 3 Geographical Scope and Price Survey Sources:

The geographic area for the CPI is determined by the geographic distribution of data sources from which the prices of goods and services are obtained for goods and services included in the CPI. Looking at the updating series of the CPI in the base year 2012, it is found that it covers all Governorates of the Sultanate except Musandam and Al Wasta Governorates in view of the small size of their population. The Wilayats representing the Governorates are selected on the basis of their population density and the geographic location of the Wilayat. As for Muscat Governorate the survey covers all Wilayats. The following table shows the geographic area for the base year 2012.

Base Year	Survey Scope
2012	Muscat Governorate (all Wilayats) North Al Batinah (Sohar, Alsuwaiq) Adh-Dhahira (Ibri) Ad-Dakhliyah (Nizwa, Samail) North & South Ash-Sharqiyah (Ibra, Sur) Dhofar (Salalah) Al Buraymi (Al buraymi)

No doubt complete coverage of all Governorate of the Sultanate is highly required but this would require huge effort for obtaining prices on a periodic basis from all governorates of the Sultanate. This would require selecting the sources which are representative of the geographic distribution of the country and allocate researches for collecting prices according to the specified periods.

Sources for collecting prices were determined by field visits carried out by a team from the Directorate General of Economic Statistics to all Wilayats covered by the Surveys for the purpose of selecting the appropriate sources. When choosing the source due consideration was given to the representative property of the source, in that it represents a purchasing point for a large segment of consumers in the particular Wilayat. The geographic distribution has also been taken into consideration of sources in the Wilayat and that it is a retail outlet, in addition to the availability of a large number of items within the sources that covers the demanded goods for the consumers basket. The total number of sources from which goods and services prices are collected reach 1721 source distributed among all governorates of the Sultanate. These sources are divided according to commodity groups as follows:

- Fresh Fish Markets: From which fresh fish prices are collected.
- Sale of Fresh Fruits and Vegetable Shops: From which fresh fruits and vegetables prices are collected in addition to the prices of dates.

- Sale of Fresh Meat and Poultry Shops: fresh and frozen meat and live chicken prices are collected.
- Frozen Fish: prices of frozen fish are collected from fish companies.
- Hypermarket: these are considered one of the main sources of price collection and they include the above mentioned sources. These outlets include Fresh Fish, Fresh Meat & Poultry, Fresh Fruits & Vegetables in addition to various commodities the prices of which are also collected from Hypermarkets. These include Rice, Flour, Other Cereal Products, some kinds of Canned Fish, Frozen Shrimps, Oil & Fats, Milk & Milk Products, Eggs, Spices and Salts, Nuts, Sugar and Sugar products, Dried & Canned legumes, Canned & Frozen fruits and Vegetables, Tea and Coffee, Non alcoholic Drinks, Some types of Readymade Foods, Different kinds of Tobacco and Personal Care items.
- Sources of Durable Goods: Price collection of durable goods differs in accordance with these types of each good where there are specialized sources for the sale of certain goods as well as joint sources for more than one good. Durable goods sources are divided into goods and services. The sources for goods include shops for the sale of Readymade Clothes, Footwear, Textiles, Household equipments and Utensils, Medication & Eye Glasses, Vehicles, Some types of spare parts, Electronic devices such as Televisions, Mobile Phones, computers, School Materials and Stationary, Other Personal Care Goods such as Perfumes and Cosmetics in addition to Gold, Silver & Furniture.

As for services sources, they include Restaurants, Laundry shops, Government Hospitals services, Private Clinics, House Maintenance Materials, Transport Services, such as Vehicles Insurance, Air Travel Tickets, Public Transport services, Car Rental & Driving Learning Schools, in addition to Car Repair and Washing services, Recreation Services such as Cinemas, Education Services, Such as Schools and Private Institutes, Personal Services such as Washing & Ironing Services, Barbering in addition to Administrative Charges such as charges for Passports and Identification Cards issues, Driving licenses and labor cards.

- Rented Units: The sample of rented units was extracted from the General Census of Population, Housing and Establishments of 2010 by taking a stratum of data distribution among the different types of housing (apartments, villas and Arabic houses), classified by the number of bedrooms. The relative importance was weighed according to the density of rented units in each governorate. The sample size of rented units reached 1150 in total distributed among all governorates, 600 units in Muscat Governorate, reflecting the density of rented units in this governorate and 550 rented units distribution among the rest of the Sultanate's Governorates. These rented units were selected according to the density of the

rented units and the widely spread types of units in each Wilayat and governorate which are collected according to the rent period.

I-4 Price Survey

Collection of price data is considered one of the most and critical phases of the Consumer Price Index compilation which requires the presence of a mechanism for organizing this important process to ensure data accuracy and confidentiality guaranteed by the statistical Law No. 29/2001. For achieving this end modern electronic systems have been used and training researches to deal with data at the field level. The price data collection operation depends on the price data collection periodicity and the collection mechanisms as follows.

I-4-1 Frequency of the Surveys

Price collection periodicity differs between commodity groups in accordance with the price changes of items in the group. There are some commodities whose prices change in a rapid and noticeable way so the periodicity of their price collection should be more frequent, while the prices of other commodities take longer thus the periodicity of their price collection surveys would be less frequent. The following table shows the survey periodicity by group:

Merchandise Group	Survey Frequency
Fresh Fish	Weekly
Fresh Fruits & Vegetables	Weekly
Frozen Fish	Monthly
Meat & Poultry	Monthly
Hyper market	Monthly
Durable goods	Monthly
Other durable goods & Service	Quarterly
Rented units	Contract period

I-4-2 Mechanism of Price Survey and Auditing

Price are collected by direct contact i.e. through field visits to shops in addition to writing to sources officially in order to explain the objective of collecting prices of goods and services. Researchers have been well trained on how to carry out field works and maintaining the confidentiality of statistical data. Moreover, a guide for the field works has also been prepared to enable researchers to deal with technical observations they might faces during data collection. Researchers have also been provided with PDA for price collecting embodying sources to be surveyed during the specific period. The device also includes the name and address of the source in addition to description of small commodities.

Preliminary revision of prices is carried out through the mechanisms built in the

PDA showing the prices changes to the researchers between the current and previous periods together with analyzing the reasons behind the charge. The researchers can also send the data by using GSM from the location of price collection in the regions. For researchers working within Muscat Governorate, they can download data directly in the data base at the center.

Revision and auditing of data phase is considered one of the most important phases in preparing the CPI. Data would be revised once again after sending to the Center before approval. In case of any price inaccuracy it will be returned in the PDA through a mechanism in the device called inspection process which determines the commodity items that need a field visit for the purpose of verifying the price by the person who will carry out this process (Supervisor). At the end, the price collected by the supervisor will be compared with the previous price which needed verification and approve the correct price.

Many revision and verification monitors exist which greatly facilitate for the supervisors the completion of their work during a short period of time after sending the prices to the data base. Supervisors have been well trained on performing this tasks and a guide explaining the steps of the office work in the CPI system was also provided.

I - 5 The Base Year

Prices Indices depend on relating the current period values to a previous value of the same item where the base year prices or reference year prices are prepared. This is the average prices of commodity items during the base year. The base year is usually the year of the Household Expenditure and Income Survey because the commodities and items are selected on the basis of the results of the surveys as explained previously. The choice of the base year should be a normal year characterized by political and economic stability and is often updated every five year. The year 2012 has been selected as a base year for price indices.

2– Calculation of the Index

2-1 The Formula

CPI is calculated in the Sultanate on the basis of the amended Laspeyres method having the following mathematical form:

$$\text{Price Index} = \sum \left[W_{i,t-1} \times \frac{P_i^t}{P_i^{t-1}} \right]$$

Where:

P_i^t = Price of the commodity in the current period.

P_i^{t-1} = Price of the commodity in the previous period.

$W_{i,t-1}$ = Average weight at previous prices.

2-2 Treatment of Seasonality and Missing Prices

Each commodity include a number of widely used items in the Sultanate for the purpose of calculating price proportionality and considered them as representing the single commodity within the commodity group. Naturally, the specifications of these items should be identified to ensure that the kinds or specification are the same when taking the prices. However, this task is sometimes faced with some problems such as the unavailability of the prices of some commodities because of seasonality clearly found in vegetables and fruits because both have their season of production or by reason of their disappearance for a certain period in a particular source or from all sources which are expected to reappear again after this temporary absence from the market. This situation is also applicable in some sources which close for short period for whatever reason. These cases are treated via a method called “Group Relative Method” Which is a process of estimating prices on the basis of the changes in prices in the rest of sources with regard to the same item or on the basis of the changes in the prices of items of the same commodity in the case of unavailability of an item of this commodity in all sources. In the case where a source is completely closed for a temporary period, all prices of that source will be estimated on the basis of price changes in sources which share the same items which are collected from this source.

2-3 Treatment of Disappearance of Good Brand and Sources:

It is worth noting that the selected goods and services basket which we named consumer basket is not always constant but changes with changes in consumption pattern and taste, in addition to the emergence of new items. Consequently items must be changed and find alternative items with a special methodology for replacing these items. If it is certain that some items have completely disappeared, they must be dis- considered and add new items which are similar.

3 - Linking the Time Series

It was referred earlier to the importance of updating the base year in view of the changes in consumption patterns and tastes due to economic and social changes. The results of this change in base year the outcome will be series of CPI with long period time. CPI's passed through many base years and to arrive at a unified series of CPI time series are linked.
